# Bare.ID User Profile

Theresa Henze - 2026-11-19 - Connect Application

> **Note**: This feature may need to be activated for your account and may not be included in your subscription. If you have any questions, please contact Customer Support.

The Bare.ID profile is the account self-service for users of a Bare.ID instance. There, users can edit their personal info, manage their credentials and view their applications and device activity. How users work with the Bare.ID profile is described in chapter Bare.ID profile.

The Bare.ID profile can replace the Keycloak account management for users.

## Create application

To allow users to work with the Bare.ID profile, the application “Bare.ID User Profile” must be connected to the instance.

- Sign in to Bare.ID at app.bare.id with an administrator account.
- On the welcome page, select the instance for which the application is to be connected.
- Click “Applications” in the left-hand navigation bar.

> **Note:** If the list of connected applications already contains an application with the Client ID “bareid-profile”, the Bare.ID profile is already connected and you can skip the following steps.

- Click on the “Add application” button.
- Enter “profile” in the search field and press the ENTER key.
- Click on the “Bare.ID User Profile” tile.

- Click on the “Save” button to connect the application. The “Custom CSS” field is optional.

More details on connecting applications can be found in chapter Connect preconfigured application.

## Allow access for all users

If the “Restrict access” option is activated for the “Bare.ID User Profile” application, only users with the “Application access” role of this application can open the Bare.ID profile. Details can be found in chapter Application-specific roles.

To give every user account of the instance access to the Bare.ID profile, assign the role to the default roles. The default roles apply to all user accounts of the instance, including newly created ones.

- Click on “Roles” in the left-hand navigation bar.
- Click on the “Edit default roles” button.

- Click on the “Roles” tab.
- Click on “Assign roles”.
- Select the “bareid-profile” application in the “Application roles” tab.
- Check the box next to “Application access”.

- Click on the “Assign roles” button to complete the assignment.

The “Application access” role of the “Bare.ID Profile” application is now listed among the assigned roles.

## Find Bare.ID profile

Signed-in administrators can find the link to the Bare.ID profile in the instance information.

- Click on “Instance information” below the name of the instance in the upper left corner.

The section “For users” contains the link “Bare.ID profile”.

The Bare.ID profile is available at `BASE_URL/profile`, for example at `https://customer.bareid.cloud/realms/[INSTANCE_ID]/profile`. Share this link with the users of the instance, for example on the start page of your application or in an email.

## Adjust the appearance

The Bare.ID profile uses the logo from the branding settings of the instance. Colors and further styling can be adjusted in the “Custom CSS” field of the “Bare.ID User Profile” application.

- Click on “Applications” in the left-hand navigation bar.
- Open the application with the Client ID “bareid-profile” by clicking on the corresponding entry in the list.
- Enter the desired adjustments in the “Custom CSS” field.
- Click on the “Save” button to apply the changes.

Users can display the Bare.ID profile in a light or dark theme. Therefore, define the colors for both themes, otherwise the other theme keeps the default colors:

```
:root.light {
  --primary: oklch(0.55 0.22 262);
  --header: oklch(0.5 0.22 264);
  --header-foreground: oklch(1 0 0);
}
:root.dark {
  --primary: oklch(0.5 0.2 263);
  --header: oklch(0.32 0.15 264);
  --header-foreground: oklch(1 0 0);
}
```

More details on editing applications can be found in chapter Reconfigure application.

> **Warning**: Custom CSS is delivered to the Bare.ID profile without being checked. Follow the advice in the articles Security Notes for Custom CSS and Security Notes for Unescaped Content.

## Disable Keycloak account management

If users should only work with the Bare.ID profile, the Keycloak account management for users can be disabled.

> **Warning**: The Bare.ID profile requires the system application “account”. Therefore, only disable the system application “account-console”. If “account” is disabled as well, the Bare.ID profile stops working.

- Click on “Applications” in the left-hand navigation bar.
- Activate the “Show system applications” checkbox above the list of connected applications to display the system applications in the list of connected applications.
- Open the “account-console” connection by clicking on the corresponding entry in the list.
- Deactivate the “Connection activated” option to deactivate the connection.

- Confirm the change by clicking on the “Save” button.

The Keycloak account management for users is no longer accessible. The Bare.ID profile remains available.

To enable the Keycloak account management again, activate the “Connection activated” option of the system application “account-console” again.
